## Fund concept

The NDR Active Allocation - Kathrein fund is a dynamically managed balanced fund-of-fund using exchange traded funds (ETFs) for the various asset classes of stocks, bonds, and money markets. The individual asset classes can be over or underweighted based on quantitative models depending on the current market situation independent of the benchmark. The investment decisions may use the research and the capital market forecasts of Ned Davis Research (NDR).

\*The Sharpe ratio compares the additional return and risk of an investment with a safe (risk-free) money market investment, taking into account the volatility of the respective portfolio.

Past performance is not a reliable indicator of future performance and returns of the fund. The performance is calculated in accordance with the OeKB method and already takes into account management fees, any performance-related fee and other costs charged within the fund. Individual costs such as the subscription fee, redemption fee or taxes such as withholding tax are not included in the performance calculation. The specific, individual amounts of these are not known and, if taken into account, would have a correspondingly negative impact on performance. If a purchase fee of 3% is charged, this reduces the performance in the year of purchase by EUR 300 for every EUR 10,000 invested. Note for investors with a home currency other than the fund currency: We would like to point out that the return may rise or fall as a result of currency fluctuations.
